## The Neurogram - A quantification of real-life hearing impairments using electrophysiology

Fabian Schmidt<sup>12</sup>, Lisa Reisinger<sup>12</sup>, Patrick Neff<sup>13</sup>, Ronny Hannemann<sup>4</sup>, & Nathan Weisz<sup>12</sup>

## **Motivation**

#### **Pure-Tone Audiometry (PTA):**

- Assesses hearing thresholds in dB using artificial pure tones (log-spaced between 125 and 8000Hz)
- Information about hearing thresholds is obtained via subjective feedback

#### **Problem:**

- Artificial pure-tones do not reflect real-life listening situations (e.g. cocktail party)
- Supra-threshold hearing loss (i.e. hidden hearing loss) is not captured using PTA
- Subjective feedback problematic for babies or old people suffering from dementia

## **Material & Methods**

- N=43 subjects
- Age = 43.49
- Online Hearing Assessment
- Stimulus material: radio play (~20 min)
- 306 channel MEG system

## **Analysis Procedure**

### 1) Acoustic Feature Extraction

#### Spectrogram reconstruction accuracy at selected channels can be related to individual hearing levels Magnetometers Gradiometers Channels with spectrogram encoding *r* = -0.46 accuracies that correlate with pure-tone p = 0.001audiometry scores are selected for reconstruction 4 0.0 0.4 Frequency (kHz) -1.00 -0.50 0.00 0.50 Neurogram/Audiogram fit (r^2) partial correlation Spectrogram reconstruction accuracy at High variance in goodnes of fit (R<sup>2</sup>) between Neurogram and Audiogram across subjects selected channels is negatively related to pure-tone audiometry scores Using several predictors (SSQ-Scores, Age etc.) to explain the goodness of fit we find that: 0.02 Neurogram Average (r) spatial hearing abilities Neurogram scores are stronger related to subjective reports of hearing impairment than audiogram scores Subjective reports of hearing impairment were assessed = 0.58 = 0.81 via the speech, spatial and qualities of hearing scale PTA/SSQ S PTA/SSQ Qualiti (SSQ) and correlated with neurogram average and pure-tone average scores NGA/SSQ Spe NGA/SSQ Qual -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 absolute correlation coefficient correlation coefficient correlation coefficient absolute correlation coefficient Posterior distributions for the correlation coefficients of neurogram average and pure-tone average scores with the SSQ scales are compared = 0.57 = 0.72 р PTA/SSQ Spatial PTA/SSQ Effort Neurogram average scores are stronger related to SSQ scores than audiogram average scores -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 -1.00-0.75-0.50-0.25 0.00 0.25 0.50 0.75 1.00 correlation coefficient
